SCDF-De11 Lifesavers' Innovation Challenge 2026

1stSight

Bodycam feed to incident intelligence

1stSight turns responder bodycam frames and location metadata into verified cues, live timeline events, source-frame evidence, and report-ready incident records.

1stSight Ops Centre incident intelligence layer

Problem

Raw video is visibility, not incident memory.

The gap is not just getting feeds to Ops Centre. The gap is turning what officers see into source-linked, confirmed operational facts.

WHERE RAW FEED BREAKS DOWN		BEFORE · DURING · AFTER	
01	Ops Centre must watch multiple feeds and mentally track what changed.		
02	Important visible cues can be missed, repeated, or trapped inside radio notes.		
03	After the incident, teams still reconstruct the timeline from memory and scattered evidence.		

Why it matters now

SCDF needs this beyond major fires.

1stSight is an incident intelligence layer for fire, medical, rescue, and responder-safety workflows.

257,158

EMS calls handled in 2025.

40,644

Trauma cases, including falls, industrial accidents, and assaults.

2,050

Fire calls still require visibility, coordination, and documentation.

One bodycam intelligence layer, multiple incident types

FIRE

Smoke, blocked path, exit cue, changing conditions.

MEDICAL

Patient access, crowd encroachment, stretcher path.

RESCUE

Entry point, trapped-person cue, unsafe access route.

AFTER ACTION

Source frames, confirmed timeline, report export.

What 1stSight does

It packages visible cues into confirmed incident records.

The frontliner keeps moving. Ops Centre reviews source frames and decides what becomes fact.

BOUNDARY

No diagnosis, facial recognition, or automated command decision.

MEMORY

Every confirmed event keeps its source frame and audit trail.

WORKLOAD

No typing, tagging, or dashboard use by frontliners during the incident.

Prototype walkthrough

The product is the Ops Centre view & exportable incident record.

The demo focuses on what you can evaluate: live feeds, prioritised alerts, scene context, confirmed handover notes, timeline events, and a generated incident PDF.

The prototype flow is visible in one place: observe, confirm, then export the record.

- 01 Alert queue shows what changed, not every frame.
- 02 Map pins and timeline events link back to source frames.
- 03 Incident record export starts from confirmed facts.

Example incident moment

One cue, one source frame, one confirmed event.

The system separates AI-suggested observations from officer-confirmed incident facts.

Source-frame evidence card

SUGGESTED CUE

Stretcher access may be constrained by crowding near corridor.

- 14:06 AI suggests patient access constraint from Medic 1 source frame.
- 14:07 1stSight pins the cue to the scene map for Ops Centre review.
- 14:08 Confirmed event enters timeline and handover summary.

Safety boundary: no medical diagnosis and no automated command. 1stSight packages visible evidence for human confirmation.

Technical credibility

Simple enough to prototype, structured enough to deploy.

1stSight can be demonstrated quickly while keeping the deployment path aligned to Dell Cloud Native Platform.

CAPTURE

Mobile PWA simulates responder bodycam with sampled frames and metadata.

INGEST

Backend receives frames, incident ID, responder source, timestamp, and approximate location.

ANALYZE

gpt-5.4-mini flags visible scene cues; deepseek-v4-pro consolidates confirmed records.

RECORD + UI

Event store keeps source frames and officer actions. Ops Centre reviews map pins, timeline, handover, and report export.

DEPLOYMENT PATH

The web app and backend services run on Dell Cloud Native Platform, creating a clear route from demo prototype to deployable system.

MODEL BOUNDARY

Inference sits behind the backend: gpt-5.4-mini for vision triage, deepseek-v4-pro for timeline and report analysis.

Advance the product that turns bodycam visibility into incident memory.

1stSight turns bodycam visibility into verified incident memory.

PROTOTYPE EVALUATION

Move 1stSight from concept to prototype.

- 01** Works with the existing direction of responder bodycams and Ops Centre visibility.
- 02** Keeps frontliners hands-free while reducing the monitoring burden upstairs.
- 03** Turns confirmed observations into timeline, handover, AAR, and report-ready records.
